

# Automated Railway Crack Detection Using Machine Learning: Analysis of Deep Learning Approaches

**2024 IEEE 15<sup>th</sup> Annual Information, Technology and Mobile Communications Conference**

**24 October 2024**

***ANDREW D'ARMS, HWAPYEONG SONG, HUSNU S. NARMAN, NEVZAT C. YURTCU, PINGPING ZHU, AND AMMAR ALZARRAD***

# Outline

- ▶ Introduction
- ▶ Methodology
- ▶ Results
- ▶ Conclusion

# Problem

- ▶ Finding cracks and gaps in railroad tracks is very time consuming when done manually
- ▶ Doing so automatically can be slow depending on implementation, so better solutions were needed

# Previous Solutions

- ▶ Machine vision
- ▶ Convolutional neural networks
- ▶ YOLOv3
- ▶ RetinaNet
- ▶ FCN and U-Net
- ▶ YOLOv5

# Limitations

- ▶ Detect unrelated defects, like scars
- ▶ Some models are slower and unable to perform real-time
- ▶ Labels are inconsistent, including box sizes
- ▶ Existing datasets too small in scope

# Background

- ▶ YOLO, or You Only Look Once, is a real-time object detection model using a CNN known for speed and accuracy
- ▶ It does this by placing bounding boxes around relevant areas of the image depending on what classes it was trained on

# Models

- ▶ YOLOv3 incorporated a feature pyramid network
- ▶ YOLOv5 started using Darknet in its backbone
- ▶ YOLOv6 focused on hardware optimizations
- ▶ YOLOv8 featured an anchor-free split head, offering better balance between accuracy and speed
- ▶ YOLOv9 improved accuracy using programmable gradient information and a generalized efficient layer aggregation network
- ▶ YOLOv10 incorporated non-maximum suppression and overall optimizations
- ▶ ResNet101 skip connections and residual blocks and is commonly used in the field, but slower

# Methodology

- ▶ Nvidia Geforce RTX 3090 used for all testing (24GB of VRAM)
- ▶ Ultralytics package used for most testing, compiles most YOLO models into one Python package
- ▶ Original packages used for YOLOv5 and YOLOv9
- ▶ Precision, recall, and F1-scores recorded (harmonic mean of precision and recall)

# Datasets

- ▶ Single-class dataset made by 'Thesis Group' on Roboflow, ~1,000 images of a variety of cracks and gaps
- ▶ Combined dataset combined original and 5 other similar datasets
- ▶ Combined dataset includes 2,000 images, 5,000 after augmentation

# Single Class Results

Performance of the Selected Models on the 'Thesis Group' Dataset for a Single Class

# Three-Class Results

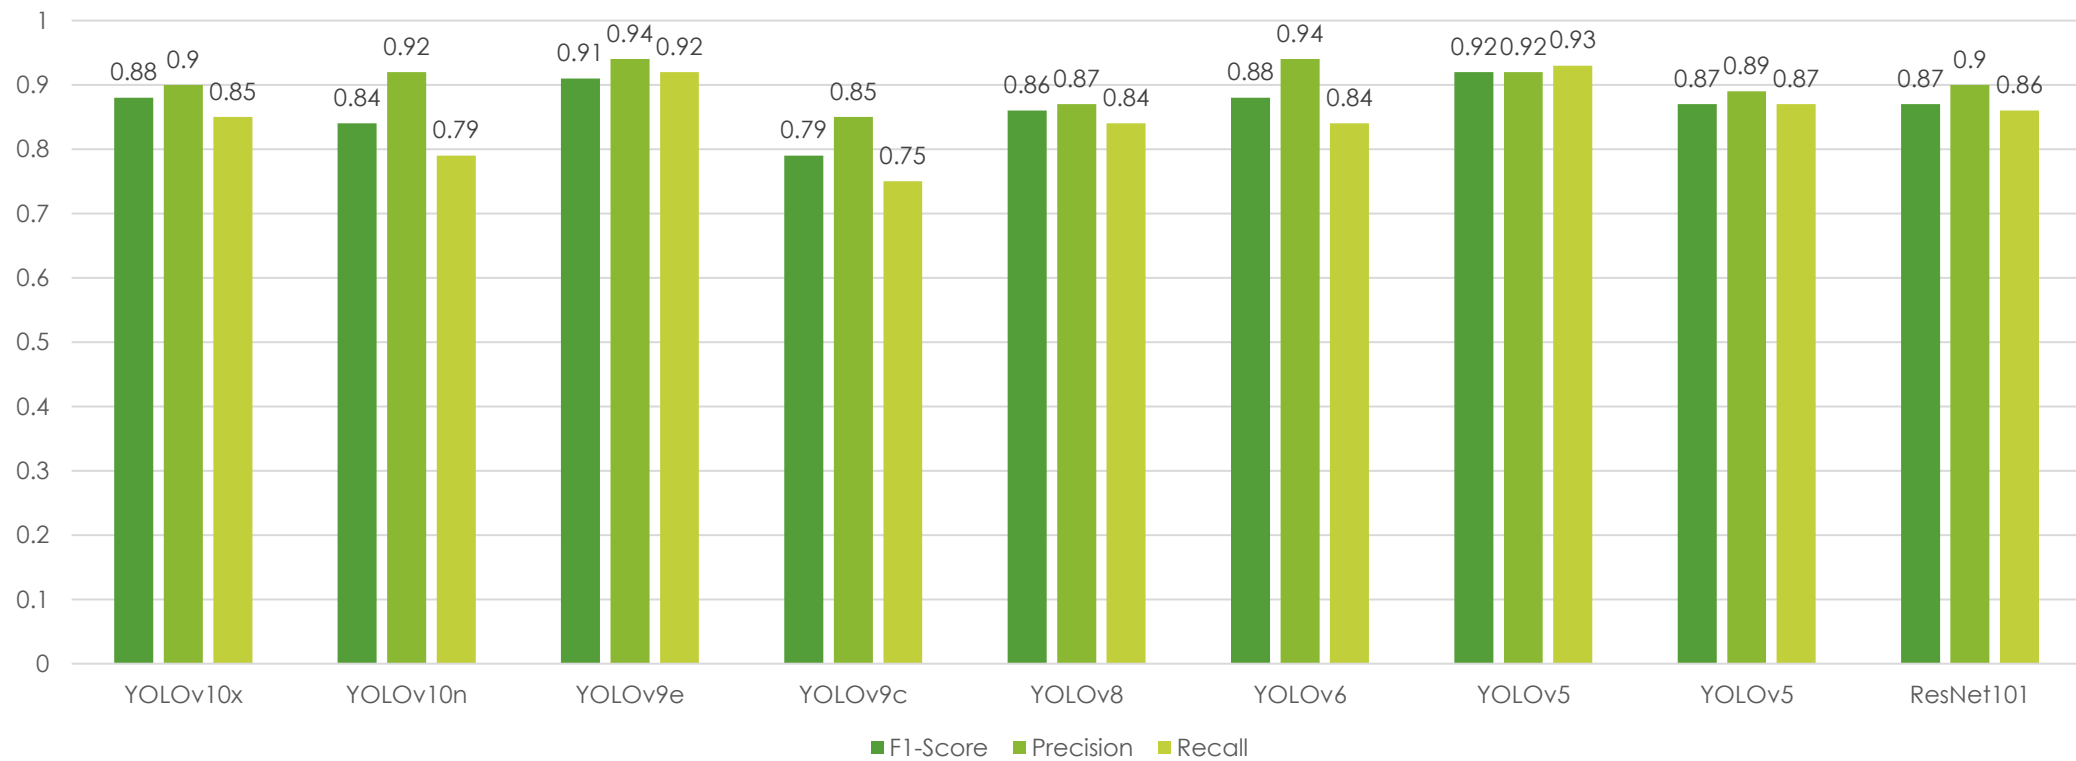

Performance of the Selected Models on the Combined Dataset for Three Classes

# Four-Class Results

The Performance of the Selected Models on the Combined Dataset for Four Classes

# Visual Results

# Visual Results

# Conclusion

- ▶ Successfully able to detect cracks and gaps with haste
- ▶ YOLOv5 and YOLOv9 performed the best, with F1 scores of 0.92 and 0.91 respectively
- ▶ Datasets have largest impact on accuracy
- ▶ Explainable AI allows future research to be more effective

# Future Works

- ▶ Field testing
- ▶ More realistic data
- ▶ Newer YOLO models
- ▶ Other machine learning models
- ▶ Model specialization
